

e-Server

e-Server is a unique Multi-threaded software that converts your ordinary PC into a **Intranet** as well as **Internet Mail Server** with built-in s **SMTP and POP3 services** ...

OVERVIEW:

e-Server when connected to a network in an organization, can act as an Internet as well as Intranet Mail Server. All users in that network can send and receive messages through e-Server without having active Internet Connection on individual machines.

It provides real time monitoring of SMTP /POP3 Statistics, total active connections, total messages sent/received by all network users and ensures secure and dependable messaging with built-in SMTP and POP3 services.

e-Server's built-in SMTP allows you to send messages straight to the recipient's mail box without using any external SMTP. Its MultiPOP account feature makes it possible to collect e-mail messages from any number of POP accounts on multiple servers and deposit them directly into the user's mailbox.

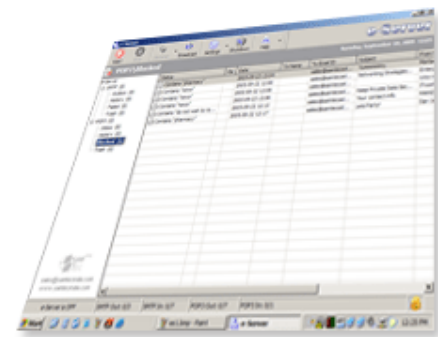

e-Server has many options like auto / manual forwarding, re-queuing, auto responders, spam mail filtering, single internet account sharing facility with the help of which you can customize the entire message sending / receiving process to satisfy your requirements.

In short e-Server ensures faster, stable, secure and more easy-to-control mail sending / receiving, and thus it helps to save your time and money.

ADVANTAGES:

- ▶ Ensures guaranteed and instant mail delivery.
- ▶ Eliminates the necessity of Internet Connection on Individual network machines.
- ▶ Instant email communication within the organization by eliminating paper work.
- ▶ Provides every individual personalized e-mail identity for internal communication.

Provides efficient **Internet** as well as **Intranet** messaging system for individuals, small offices as well as large corporate networks.

FEATURES:

General

 - ▶ Prevents users from sending mails outside network
 - ▶ Broadcasting common messages
 - ▶ Storing complete history of mails received, blocked, retrieved and delivered

POP3

- ▶ Forward copies of incoming messages to one or more internal or external account
- ▶ Facility of auto-response / vacation mails

OPTIONAL MODULES

Blue Shield Firewall: BlueShield protects your PC from unauthorized SMTP / POP3 access and port scanning attacks intended for open relay.

This module helps to keep your computer more secure. It restricts information that comes to your computer from other computers, giving you more control over the data on your computer and providing a line of defense against people or programs including viruses and worms that try to connect to your computer without permission. It acts as a barrier that checks information coming from the Internet or a network and then either deny access or allow it to pass through to your computer, depending on your firewall settings.

BlueShield blocks access attempts from hackers and other unknown threats.

Red Shield Anti-Spam: RedShield protects your INBOX by filtering out unwanted Junk / SPAM and specific Virus containing mails.

With fraudulent, inappropriate and offensive emails being delivered in vast quantities to businesses every day, Anti-Spam solution is a vital component of your network security. Spam leads to wastage of network users' time and network resources, and can also be dangerous. RedShield when activated at the server, eliminates the need to install and update Anti-Spam software on each desktop. It filters out all the junk and unwanted mails into the junk folder thereby preventing them from reaching the user's mailbox

RedShield monitors and prevents potential threats in real-time, before they can damage your system.
